## **Exploration of Data:**

Exploration of Data relationships among the values is presented along with plotting of Average Age for different Chest Pain Types. For visualizing it, we will require the following data:

- \* Sex
- \* Age
- \* Chest Pain Type

From the bar graph, we can observe that among disease patients, male is higher than female.

### Chest pain distribution according to target variable:

Chest pain (cp) or angina is a type of discomfort caused when heart muscle doesn't receive enough oxygen rich blood, which triggered discomfort in arms, shoulders, neck, etc.

However, looking at the bar graph above, it raised a question of higher number of healthy subject having typical angina. Or in other word, most of the healthy subject having chest pain, which is also discussed [here](#).

Chest pain can be subjective due to stress, physical activities and many more and varies between gender. Women and elderly patients usually have atypical symptoms with a history of disease. This [article](#) provide analysis comparing typical anginal vs nontypical angina patients in a clinical trial.
